Sales-Tech Infrastructure & Pipeline Optimization Engine

****Author:**** Andrew P. Casto | Principal Consultant, Equipment Leasing LLC

****Role:**** Technical Infrastructure & Security Research

Overview

This repository contains the core logic framework for a custom outbound engine designed to bridge the gap between technical infrastructure and revenue generation. The engine utilizes "no-touch" public metadata discovery, validates cross-platform environments for security compliance, and applies predictive behavioral analysis to automate high-velocity transaction pipelines.

Key Features

- * ****Metadata-Driven Discovery:**** Safely gathers public domain and infrastructure data without invasive probing (Strict "No-Touch" Policy).

- * ****Infrastructure Auditing:**** Validates DNS configurations and security headers to identify pipeline friction or expansion opportunities.

- * ****AI-Assistive Lead Scoring:**** Programmatically applies BANT/CHAMP qualification metrics based on technical signals.

- * ****Secure CRM Integration:**** Automates touchpoint frequency by syncing qualified data directly to Salesforce/HubSpot using secure, environment-variable-managed API endpoints.

Note: This repository contains sanitized framework code for demonstration purposes. All proprietary data, client identities, and active API keys have been strictly redacted to ensure SOC2 and privacy compliance.
